DIE MARKE

THE BRAND

„Ein Pionier im Skibau gewesen zu sein“, das wird unserem Gründer Anton Kästle immer wieder nachgesagt, baute er doch bereits 1924 sein erstes Paar Ski in der Hohenemser Wagnereiwerkstätte.

Mitte der 1970er-Jahre stiegen wir dann in das Langlaufgeschäft ein. Mit abermals mutigem Tatendrang und hochgesteckten Zielen. Erfolge kommen nicht von ungefähr, sondern sind meist das Ergebnis harter Arbeit. Somit reihten sich in der Alpiner Rennlauf-Hochblüte der 1980er-Jahre schnell auch die Langläufer ein.

Mit Mut kehrten wir 2019 in die Nordische Welt zurück und präsentierten gleich zum Start die ersten Langlaufski mit unserem selbst entwickelten Hollowtech. 2020 legten wir mit Ski im außergewöhnlichen Kästle Mint Design nach. Dieser Tage, drei Jahre später, ist die Farbe, die sich im Schnee so faszinierend gibt, nicht mehr wegzudenken.

Kästle steht mit seinen Produkten für Performance, Qualität und Langlebigkeit. An unserem Produktionsstandort im tschechischen Langlauf und Mountainbike Mekka Nové Město na Moravě wurde daher zuletzt massiv in modernste Anlagen investiert, um den hohen Ansprüchen an die Herstellung eines Kästle Skis gerecht zu werden.

In Nové Město na Moravě, praktisch direkt an der Loipe, befindet sich auch unser Nordic Competence Center, wo das Nordic Race Departement und die R&D-Abteilung für Langlauf- sowie Sprungski Platz finden.

Kästles Steuerzentrale befindet sich dort, wo alles begann, in der altherwürdigen Produktion in Hohenems. Heute gilt sie eher als feine Manufaktur, die zum Herzen der R&D-Abteilung und des Alpiner Race Departments geworden ist. Rauchende Köpfe warten hier Jahr für Jahr mit Neuerungen und Weiterentwicklungen auf, mit dem Ziel, die Erfolgsgeschichte fortzuschreiben.

Daran arbeiten wir als Marke – jeden Tag.

„A pioneer in ski construction,” is what our founder, Anton Kästle, is said to have stated over-and over again, as he built his first pair of skis in a wainwright’s workshop in Hohenems, back in 1924.

In the mid-1970s we started manufacturing cross-country skis, once again with bold drive and ambitious goals. Success does not come by chance, but is mostly the result of hard work. Consequently, cross-country skiers quickly joined the ranks during the Alpine racing heyday of the 1980s.

With courage we returned to the Nordic world in 2019 and presented the first cross-country skis with our self-developed Hollowtech right at the start. In 2020 we followed up with skis in an extraordinary Kästle Mint. These days, three years later, the color that is so fascinating in the snow has become iconic.

Kästle products stand for performance, quality and durability. At the second production facility based in the Czech cross-country and mountain biking mecca of Nové Město na Moravě, significant investments have recently been made to meet the high demands of manufacturing a Kästle ski. There, almost directly beside the cross-country ski track, you will find our Nordic Competence Center, where the Nordic Race Department and the R&D department for cross-country as well as jumping skis are located.

Kästle’s headquarters are located where it all began: in the time-honored production facility in Hohenems. Today it is considered more of a design lab, which has become the heart of the R&D department and the Alpine Race Department. Here, brilliant minds create innovations and further developments year after year with the goal of continuing the success story.

This is what we as a brand work for – every day.

The image shows the Kästle logo on a brick wall. The logo consists of a stylized arrow pointing upwards, followed by the word 'KÄSTLE' in a bold, sans-serif font. Below 'KÄSTLE' is the word 'MARK' in a stylized, outlined font. The background is a brick wall with a concrete ledge in the foreground.

RACE

NORDIC

Seit dem Wiedereinstieg in den Nordischen Rennsport konnten wir ein konkurrenzfähiges Team von Athleten aus den Sparten Langlauf und Biathlon aufbauen. Die Weiterentwicklung der Rennski für die Königsklassen des Winter-Ausdauersports findet unter großem Einsatz rund um das Team von Vit Fousek und Martin Petrásek statt. Nur durch unzählige Stunden an der Loipe und der Messmaschine gelingt es, aus dem Weltcupmodell RX10 WC die maximale Performance herauszuholen. Vor allem spiegelt sich dies in der Entwicklung von Strukturen, Belägen und dem extrem wichtigen Aufbau der Spannungskurve wieder.

Damit die Ski nicht nur unter den in Mitteleuropa herrschenden klimatischen Bedingungen exzellent funktionieren, bereist das Nordic Race Department jährlich die Kernstationen des FIS- & IBU-Weltcups, um auch dort eine meisterhafte Abstimmung der Ski vorzunehmen und für unsere Athleten und Partner das perfekt funktionierende Produkt anzubieten.

„Aus dem Rennsport für die Loipe“ trifft selbstverständlich auch für den Nordischen Teil des Kästle Portfolios zu. Die Innovationen aus dem Rennsport finden sich in den restlichen Modellen des Nordic Segments wieder, immer auf die Bedürfnisse der jeweiligen Läufer abgestimmt, um jedem das gewisse Rennsportfeeling zu vermitteln.

Since the return to Nordic racing, we were able to build up a competitive team of athletes in cross-country skiing and biathlon. The development of racing skis for the top divisions of winter endurance sports takes place with great dedication by the team surrounding Vit Fousek and Martin Petrásek. Only by spending countless hours on the track and on the measuring machine it is possible to get the maximum performance out of the RX10 WC model. Above all, this is reflected in the development of structures, bases and the extremely important construction of the tension curve.

To ensure that the skis not only work excellently under the climatic conditions prevailing in Central Europe, the Nordic Race Department also travels each year to the core destinations of the FIS & IBU World Cup in order to carry out a masterful tuning of the skis in different conditions in order to offer the perfectly functioning product for our athletes and partners.

„From racing to the track“ naturally applies to the Nordic part of the Kästle portfolio. The innovations from racing can be found in the remaining models of the Nordic segment. Always tailored to the needs of the respective skiers, to give everyone that certain racing feeling.

POLES

KC100

ITEM.NO. ND004

Length: Freesize 150 | 165 | 180 cm, can be shortened up to 15 cm

Weight: 183 g (150 cm)

full carbon shaft with thermo-cork grip combined with a clip system which allows to take off the pole quickly without unfasten the strap. Thanks to the QCD technology (Quickly removable disk) changing the basket together with the tip can be done in seconds.

KC70

ITEM.NO. ND002

Length: 130–170 cm (5 cm steps)

glass-carbon construction with adjustable strap and anatomic cork composite grip, hardened tip

Weight: 185–225 g (≈5 g steps)

KC30

ITEM.NO. ND005

Length: 120–165 cm (5 cm steps)

Weight: 221.5 g (160 cm)

glass-carbon (30 % carbon) shaft with ergonomic and adjustable strap combined with thermo-cork grip

TECHNOLOGIE

TECHNOLOGY

Was unsere neue Generation von Langlaufski ganz oben positioniert, hat seine Wurzeln in den 1970er-Jahren: Es ist die pure Innovationskraft. Damals meldeten wir die ersten Patente für den Langlaufsport an. In diesem Geiste entwickeln wir auch heute Technologien und Konstruktionen, die vom Profibereich in Serie gehen.

Der Weg zur Spitze ist jedoch ein harter. Ein fertiger Langlaufski besteht aus neun verschiedenen Schichten. Würde man jeden einzelnen Bestandteil, jedes Holz und jede Faser zählen wollen, bräuchte man wohl bis zur Unendlichkeit – und noch viel weiter. In der Produktion sind mehr als 200 Mitarbeiter mit unseren Kästle Ski beschäftigt, mehr als die Hälfte hat sie von der Vorbereitung bis zur Endaufbereitung an insgesamt 34 Stationen mindestens einmal in der Hand. Die Rechenaufgabe der Gesamtzahl aller Handgriffe, überlassen wir gerne Ihnen!

Hauptbestandteil unserer Top-Ski ist der Aramid-Wabenkern. Dafür nehmen wir uns ein Beispiel an der Tierwelt: Nirgends ist das Überleben härter als in der Natur – dementsprechend ausgeklügelt sind die Lösungen, die hier zum Einsatz kommen. So haben Bienen mit ihren Waben in Sechseckform eine ideal stabile Konstruktion entwickelt, die maximale Festigkeit bei geringstem Materialeinsatz ermöglicht. Im letzten Jahr haben wir exakt 879.894 m² Wabenkerne verbaut – das entspricht ungefähr der Fläche von 255.042 Bienenstöcken.

Für die robusteren Modelle verwenden wir Holzkerne im Herzen der Ski, die optimale Torsions- und Biegesteifigkeit mit sich bringen.

What positions our new generation of cross-country skis at the top is entrenched in our 1970s ethos of pure innovation. Back then, we registered the very first patents in the sport of cross-country skiing and it is in this spirit that we develop our technologies and construction methods today when taking professional skis into series production.

However, it is a long way to the top. A finished cross-country ski contains 9 different layers. If you wanted to count every single component, every piece of wood and every fiber, you would probably need to go to infinity - and much further. In production, more than 200 employees work with our Kästle skis, and about half of them hold the skis in their hands at least once. From preparation to finishing, a total of 34 stations are used. We'll gladly leave the math to you!

The main ingredient for our top-shelf skis is aramid honeycomb. For this, we take inspiration from the animal kingdom: nowhere is survival harder than in nature – and the solutions we apply here are fittingly sophisticated. Bees, with their hexagonal-shaped honeycomb, have developed a very stable structure that results in maximum strength for minimal material input. Last year, we used exactly 879.894 m² of honeycomb – that equals the size of approximately 255,042 beehives.

For our more robust models, we use different woods for the core of the ski, to ensure optimal flex and torsional rigidity.

Ummantelt wird der Wabenkern von einer Torsionsbox, bestehend aus verschiedenen Hölzern – gerade für die Skater ein wichtiger Bestandteil, ermöglicht sie doch eine bessere Kraftübertragung und optimalen Rebound.

Nicht unwichtig hierfür ist auch der neue, viel dynamischere Aufbau der Kammer. Gerade bei den Classic-Ski bietet er schnelleres und geschmeidigeres Gleiten sowie den perfekten Kick.

Ähnlich wie bei den Alpinen Ski werden auch im Nordischen Bereich diverse andere Materialien als Einlagen verwendet, um die Gleiteigenschaften maßgeblich zu beeinflussen:

Carbon gilt als außergewöhnlich belastbar und dennoch leicht. Ein sehr facettenreiches Material, das äußerst interessant für den Skibau ist. Bei uns kommt es in fast jedem Ski zum Einsatz.

Glasfaser überzeugt mit ihrer hohen Elastizität. Um die perfekte Kombination aus Stabilität und Biegsamkeit zu erreichen, wird sie oft in Kombination mit Carboneinlagen verwendet.

Der Belag als Beschichtung der Lauffläche ist ein weiterer wesentlicher Bestandteil unserer Ski und maßgeblich für ihre Gleiteigenschaften verantwortlich. Bei unseren Langlaufski setzen wir fast ausschließlich auf gesinterte Graphitbeläge - für maximalen Speed und hohe Langlebigkeit. Bei den knapp 23.000 produzierten Paar kamen heuer 8.530.018 cm Belag zum Einsatz. Damit könnten wir die Biathlon-Strecke der Weltmeisterschaften 2013 in Nové Město 21,25 Mal auslegen – aber wer will das schon?

Das Ganze wird jetzt noch mit einem Topsheet im auffallenden Kästle Mint-Design abgerundet. Alle Teile werden nun verklebt und gepresst. In unserer Produktion in Nové Město schaffen wir es, jede 2 Minuten und 46 Sekunden ein Paar Langlaufski fertigzustellen. Das entspricht in etwa der Dauer des Liedes „I'm A Believer“ von The Monkeys. Ja, wir sind „Believer“ und davon überzeugt, dass sich harte Arbeit auszahlt. Für innovative Ideen, für revolutionäre Produkte, für die Leidenschaft zum Wintersport, für euch!

Bei der Produktion sowie der Material- und Lieferantwahl versuchen wir, so gut es geht, auf Nachhaltigkeit zu achten. Transportwege kurz zu halten und, wo möglich, recycelte oder natürliche Rohstoffe zu verwenden ist das Credo. Die perfekt grüne Skiproduktion haben wir leider noch nicht erfunden, aber wir versuchen uns in kleinen Schritten anzunähern, und auch unsere Produktionsstandorte dementsprechend zu gestalten.

The honeycomb core is encased in a torsion box consisting of various woods. An important component for the skaters in particular, as it enables better power transmission and optimum rebound.

Not insignificant for this purpose is the new, much more dynamic chamber setting. Especially for classic skis, it offers faster and smoother gliding, as well as the perfect kick.

Similar to Alpine skis, other materials are used in the Nordic segment as well. As inlays, they significantly affect the skis properties:

Carbon is considered to be exceptionally strong, yet light. A very multifaceted material that is extremely interesting for ski construction. We use it in almost every ski.

Glass fiber impresses with its high elasticity. To achieve the perfect balance of stability and flexibility, it is often used in combination with carbon inserts.

The base, as the coat of the running surface, is another essential component of our skis and is largely responsible for their gliding properties. For our cross-country skis, we rely almost exclusively on sintered graphite bases - for maximum speed and high durability. A total of 8,530,018 cm of base was used in the almost 23,000 pairs produced this year. With that, we could also cover the biathlon track of the World Championship 2013 in Nové Město 21,25 times - but who wants that?

The whole thing is now rounded off with a topsheet featuring the eye-catching Kästle Mint design. All parts are now glued and pressed together. At our production in Nové Město, we finish a pair of ski every 2 minutes and 46 seconds. That perfectly matches the time frame of the song „I'm A Believer“ by The Monkeys. Yes, we are „Believers“ and convinced that hard work pays off. For innovative ideas, for revolutionary products, for the passion for winter sports, for you!

In production as well as in choosing materials and suppliers, we try to pay attention to sustainability as much as possible. The credo is to keep transport distances short and, where possible, to use recycled or natural materials. Unfortunately, we have not yet invented the perfect green ski production, but are attempting to get there gradually and to design our production sites accordingly.
